

ACTIVE OIL TRAWL

Active Oil Trawl is a "3 in 1" solution for all-round and effective oil spill operations in sheltered waters and harbours.

The system consists of the following details:

Guide booms to concentrate and guide the oil into:

The wave pump bringing the oil into the: **Storage tank** where the oil and water is separated and the oil is stored.

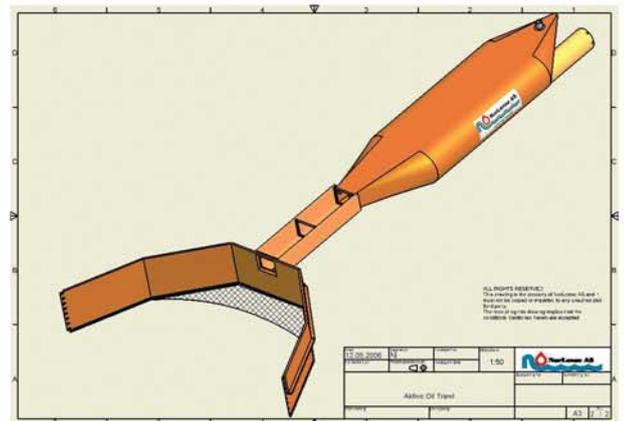

The storage tank comes in different sizes, but the 10 m³ is delivered as standard.

The storage tank can be disconnected during recovery operation and towed a shore for emptying.

New storage bag can be connected to the boom system or the system can be closed and used as a "normal" oil containment system.

The guide boom can easily be connected to other booms to form longer guide booms to cover a larger area and collect more oil.

The **Active Oil Trawl** is suitable for rivers and areas with strong current.

Modell	Freeboard	Skirt	Length guide booms	Storage capacity
AO-50-F	50 cm	64 cm	7,5 m both sides	10 m ³
